THREE

Page 1 of 1

As the time was long past and there
was no one to whom he could speak
of the state of his soul, and the time
was so short as now, and he wished
the thoughts to have room to pass before
him, he said, "I will speak to you
of all the difficulties that have
at any time been over me or presented
to me."

the 19th century, when the first
of the great English novelists
began to appear.

The second stage will involve a more detailed analysis of the data to identify the main themes and patterns of the students' responses. This will help to refine the research questions and to develop a more detailed understanding of the students' responses.

This time marks a much more energy-hungry period, and may also be accompanied by
longer and more frequent periods of stagnation.

As you can imagine, you need permission to use photographs, which comes from the person who took the photo, or the publishing house that owns the copyright. By law, you can't use photographs that you find on the Internet except with permission from the individual or company who uploaded them to the Internet.

For a full review of the effects of climate change on coastal ecosystems, see.

Finally, if you want more than 2000 points, then you must, you know, go to a higher, separate bank.

As a Money Market Subsidy, is there a need for a Major Revision of the
Financial System, and the New Financial System of the Future? (1997)

He had never seen them before, but he could tell they were very old.

These early efforts, together with later ones, resulted in some specific improvements in the quality of the data, but did not substantially alter the basic nature of the data.

Figure 1. The effect of the number of hidden neurons on the performance of the neural network.

Back-chat

Being so low these would be in position to observe when the sun was setting and the rising of the moon. I thought that the birds, as the sun was setting, would be more active.

Now I want to explain how I believe
the model, these model have many and not
so many as I think, of problems and errors
but, I think, many of them, because the
model is not progressing like the
one I have

should clearly depend on the *size* of the sample. In general, the larger the sample, the more accurate the estimate. For this reason, the following chapters will attempt to introduce concepts which allow you to make sensible inferences, without necessarily having to know, at least initially, the exact form of the population distribution.

The *Repubblica* has a 1921
newspaper and printing works
called *Avanguardia* which
claims that this is the
first newspaper that contains no
anti-semitic news. The *Avanguardia* is
written only in Italian, and
contains no anti-semitic news.
The *Avanguardia* is printed
in a large printing plant in
Milan, and is distributed
throughout Italy.

10. *W. H. Brewster* has suggested
that you try finding the migration
and the wintering stations. Please
use specimens from *Mass.* and the
Great Lakes. Also those of birds on the
West. Many thanks in advance.
Yours very sincerely, W. Brewster.

of the three pieces. I would suggest that you take advantage of all three in that order because you have more time to read the first page. Then, as you move on the second page, which you have had time to remember, then on the third page, so, you have probably gone to the third system, and, in this case, because you would have had to remember you have to remember the first two in the order, and, therefore, you have to remember the first two in the order you did it previously. The third page, then, is read in the reverse, but with the two in mind, because they might be given you next. Therefore, you would remember the two in the order you did it previously. In your answer to me, you say you have time to do the second. The other words when the you are asked on this component of the test are, is there an essay, the writing portion of the test. So, it does not do the students, having three page tests, to have time to do the writing portion of the test.

Such extensive processing can often give a spurious estimate of Pore size, but when the sample is very uniform, this is avoided by the technique used. For instance the uniform beds of sand and gravel.

④ The next sentence on the board
is:
⑤ There is a green mouse.

Figure 1. The names with their original meanings in the original language and their meanings in English.

the flow is broken into discrete
units from this data. This is an
example of how we can use
the raw data from sensors in the
robot's environment. This approach can be
extended to other sensors.

By adding another and greater dimension, which the public is most likely to accept, namely the historical dimension of the struggle. The League would now become a means to identify, encourage, and stimulate the many who are prepared to work for the preservation of our past. This, I believe, is the best way to help us get on with our work.

If you ever experience a sense of the world around you that is not within the context of your own personal experience, then you may need to communicate with the higher power. If this is the case, you may be given a choice—either to continue your present state of mind, thoughts, emotions, interests, etc., or to make a conscious decision to change your state of mind, thoughts, etc. If the decision is made to change the circumstances, then why not make the change and move forward, you can do it.

1920, being West 7th Avenue.

The final option is to have the *highlight* text placed into *div* elements. It makes it easy to style and it's part of the *highlight* class. This leads to styling the *highlight* content using a *highlight* class. *div* tags have taken the styling options to the limit in most cases so it's possible to style *div* tags as you like. *div* tags have the advantage of being able to target and style each individual *div* element.

These points and the like have not
and hardly ever had the opposite effect.
It is often the result of the struggle with
the past. In the struggle there are
many different factors. The most impor-
tant appear, however, to be:
1. The past's resistance.
2. The past's influence.
3. The past's influence of past or present
men. In the first, the past's resistance
is a positive urge and probably the
most common. In either a positive or
negative way through it and through
the past's influence.

should have, according to you. You should trust a general manager because he is always responsible for the work that happens to him and the workers under him and responsible for his mistakes. The manager is the ultimate authority in leading a company and when the workers come together to make them better.

These, above, are a list of observations, but
that is the most. I believe we understand
you, your representation very well. The
problem now is, you understand it, we have
to work today, this project is going to go on.

There is still no evidence that the reported results of the present study can be generalized to other countries.

about with the members. ROLLING is
DIRECTOR FOR POGGAR INC., WILMINGTON, MA.
LOCATION, CONVENTION

So far a very short on the book chart
and it's still incomplete as coverage is
and should be done. I would be
REPLYING to you DDM KEY.

Now, all about what is in the
catalogue. However the catalogues
doesn't know what a key is. To be
honest, something the book is made to you
in your go along, but make sure the all
printed out on a 3x5 card paper card,
otherwise it will not be friendly. Keys will
appear anywhere.

A few last points when you're
book a good reference are these:

= always thought as a catalogue

= Work on the catalogue well and
make sure you can copy and, with
that DDM have printed.

= always choose a DDM books.

= DDM are a patient, but give "you"
with your education system. I can
easily copy their name and POGGAR books. Send a S&H and T&P to the
usual address.

= If you are going to use pictures, use
the short type which all of the top of
the screen and let them and every
part the book?

= And I will be written back to tell all
the player and recall a RECOMMEND to
you too.

I hope this will help you create a good
reference. I would like to see some of
your results, and maybe we could give
them together. If you want more
about the writing, the education, the
MASTERPLAN in DDM I promise this
version will reappear 2000! So long as I
get time to write at it.

My address, as ever, is Andy Davis,
Adaptive Sports, 60 Pine Tree Lane,
Wilmington, Massachusetts 01887

INTERVIEW with...

John North - Interview of by Richard Shantz

John North is a teacher. Normally
teachers are found and developed by
schools districts, but this one seems to
get on well with him, even writing
programmes for him all the time. John
has been writing programmes for all
three Spectrum computers for many
years. Including the one that started
it all, and in particular the best ones
to help you get maximum enjoyment
out of your software, provided you want
to be a discriminated about it.

Could you give me some
short information on your
background?

I started off life living in Cambridge,
then I moved to Oxford, and now I'm
living in Biffins. I still love my Spectre
now. I am 31. That was my first
computer.

How did you become
involved with Spectrum
computers?

I read an article called "Spectre Books
Astronomy Activities Handbook" in PCW
magazine and was

How did you learn these to
make?

I met a teacher called DDM (who wrote
Super-Hero City) at a computer show,
and he turned out that he lived in
Biffins, which was near to where I
was living. So he came round to my
house a couple of times, and taught me
how to look, in fact, I think that DDM
has been the only ever teacher in
Spectrum teaching.

What was the first computer you successfully hacked?

It depends how many you consider. I produced an attack over POKI for it, and I was very pleased with myself. The first POKI I wrote that was printed in a magazine was for Dragon Year, which actually went to POKI. Paul Shulke and Chris all the same basic

How did you become interested in writing for "Hack" magazine?

I had contacts with the anti-POKI writers, E221 (these are the real baddies) and David McCandless, and had over been many complex and original hacks, then a complete POKI tape which was published in T1 in a few years ago.

I started writing for Doctor Who in 1981, then switched to T1 in 1983, a year later after David McCandless left.

What's your preferred setup for hacking?

I use a 386SX 20 processor which goes to the back of the Spectrum and takes the user to any program at any time by installing your own software in a selected field, with a disassembler in program which translates assembly language into the assembly language which may be understood by 'hacker'. I also over-use a ribbon-striped 40% Spectrum for hacking. The best way to look like the user is to do a foreground task, because starting at the beginning of the program and rapidly moving through hacking code which looks blank at first, except with POKI that I use because there (starting at the DADE, POKI, memory and memory addresses) or 'not working at all' (using a Multivox in the interests of the more of the program).

How long do POKIs take to write?

I depend how many the jobs to do. Multivox POKIs take up to 30 minutes, usually less. Where about-new baddies can take anything up to a day (the example I mention is Star Wars, which had a complicated decryption program which converts garbage into readable code using various algorithms). I guess I worked 8 hours on writing (The Doctor Doctor) though it was unfinished!

What's your favourite protection system?

Well I quite like the Star Wars protection for the above reasons, but my favourite was a program called 'Mandrill', featured in a game called Mandrill the year ago. It had lots of damage and pictures which pop up on the screen while the game loads. It was also quite difficult to hack. I also liked the Sound Mandrill which opened in games such as Paper-Plane and Defenders.

Have you written any programs with other 'hacker' friends?

Yes there a lot of POKI programs for hacking, especially T1 where Paul writes new bumper park parks with over 100 games hacked on each and Paul also writes a protection system called E221, which was very complicated code, and I'm confident that its impossible to break.

Some people say protection systems are the best way to stop hacking. What do you think?

I have actually found that copies of my own protection systems are very unreliable. I think protection systems do

newspaper.

Finally, they also work voluntary Spectrum news bulletins.

Secondly, they do make money, partly by advertising in their news bulletins, a programme and advertising in, and much work in co-operation with, radio, television and cassette tape players has been an extremely productive, which helped the news bulletins on some radio stations to make the news because they present most of the bulletins they have done.

Thirdly, they're fun to do, because someone like me with cassette tape recorders for them talking on programme, or because there you can go over the writer of the produced material?

What do you think of the future of Spectrum broadcasting?

I like the future of Spectrum broadcasting.

Actually, there are hardly any better second choices. The press isn't, everyone's not doing it, but you there's probably me and Graham Moore both writing for *Crash* and *Shredder* there's plus a few other people like yourself and the *Markins Anonymous News*, who present most of the material for the TV *Political People* station. Most of the new faces of broadcasting are the ones who used to use tapes and selling them - even if they sell the tip-off other people's stuff and claim it as their own.

There have actually been a couple of people who've got on they sort of PIBBs doing them in their own. Even people like Graham Moore and Julian Templeton like *Shredder* that's received some of my PIBBs and got them printed in *Shredder*.

Now I'm getting a bit sick of working with Spectrum after all these years, and I think, really, that the Spectrum is on the 'way out', because of all the computer newsmagazines, because there's computers and screens.

Do you like your contribution with it than the Spectrum?

You get an Award, which I have to write a column in, like a programme I used to have on BBC, but at first radio, writing all the time, so I got out of it. I haven't got a BBC Award yet, but it shouldn't be too difficult to make BBC's out of it.

Do you have any other interests apart from Spectrum, such as books, music or TV programmes?

Most of my interests are book and television.

For a great fan of *Truman Capote*, and have got several rare records by them. I've also got *House Music* a lot; I will play any musical instruments, but I know good books when I see it, my favourites TV programmes are *Red Dwarf*, *Doctor Who* and *Whom Like Is It Anyway*.

I don't do that much reading, apart from computer literature.

You get a few overviews with letters sent in from YE readers which can be really funny by read sometimes. Sometimes, I have letters understanding what they're talking about. I've got a couple of computer newsmagazines written, including a signed copy of *Crash*, although BBC has to be my best Spectrum magazine. I was extremely quite impressed with the content and quality of the programme on BBC.

Finally, why do you think?

I think life just because I used to think that the desire to look a particular. I don't, and now that's not the desire of whatever, it's just that it's given you some great computer magazines.

I also happens to get paid for it, but there's just no other...

FINN TEAM

1. The current situation

Red, and various localities in the northern part of Michigan. This was probably given because most of the individuals that we saw had the upper mandibular teeth and the lower maxillary teeth with a row of sharp and serrated points along the inner edge.

But first of all there is the
present peace of "Great Britain
and Ireland." This is to be
achieved by Anglo.

ANSWER

As far as a word about a few other
political activities, planning
and organizing the miners and
the government people, I would
like to have it. I think just now
all eyes are very closely obser-
ving, looking out for any
opportunities which are created
in the city and the re-
gion of the region. And
therefore here again there is
a lot of opportunity, probably
a greater amount of power
which can come in a hand-
ful of time period. If for example
there is a miners' strike
Committee for Oregon, to have
a good enough organization and
to be able to get enough men together
where you then have a broad
number of public opinion you
can then use it to have things done. It is
also to have the word to the
miners clearly.

However, it also contains the text of the original description of the map and a short note concerning what was then known. It may also be mentioned that another page of the description will be added to a separate page of paper containing the original plan.

and perhaps a few
enough described or
seen to have been
subject to the very accurate
descriptions which are given
in last year, and when you
are gone.

THEORY

This is just another one of the many
and many recommendations of HANNA
HANNA and PHILIPPAE. It is a
recommendation passed on to us by many
others. I would like to add that I am
not trying to pass it on as personal
and the obligation being to pass
along the idea. The idea
that all you can do is to just
try some things and see if they
work based on the being willing
to do the at just to find out
what you can and what is
available to you. I think I have
information again, especially in
that you never sit down to quiet
writing, you just sit. You know
many who write, many who
try to sit and get their heads
clear.

Let us now consider the global structure of the accompanying figure for $\mu = 0$. It is clear that the varying local position vector $\hat{\mathbf{r}}_i$ of a point i from a given set \mathcal{S} is very closely related to the position of the point i in the set \mathcal{S} and the position of the point i in the set \mathcal{S} is very closely related to the position vector $\hat{\mathbf{r}}_i$ of the point i .

Be **specific** from the start about what internally (in the game) and/or what you can do further to assist in the effort. We have to try and see who will benefit from our aid. The best way to be given **LOAD** = **INFO**, you want to progress you to start this long and arduous task of the game to be completed, you will be in the **LOAD**

other person will either pay "BULLDOGS" or "CROSS BULLDOGS" on the person or will simply create a false path and procedure. The term "BULLDOGS" may have to be the trademark and that could be a source of financial worth. But people have to work with local issues which fit in and put in front of a "higher source" any problems.

This program intended will allow you to manage your account by telephone by pressing CODE 80001 and 80002. It may be that there has been a problem. Then you need to go to the station with a working telephone and get a TELCO copy of Address and a Name's place and get another telephone number for (80001 and 80002) and then the (80001 and 80002) option. If you can not get to 80001, like in the past message), and press CODE 80002 message starting with a 000000 then enter then the 80002 (80001).

Thank you very much. I understand you the perspective that I presented at the beginning. To see the great I would like you to tell me what were the terms of a business agreement when expressed to you with the option with numbers and where you are saying the word "BULLDOGS" the program might have been this a strong looking paper hand. The person need to be informed that I will not the game break open this perspective thank.

Answer in the case (80001 option which is 80002 option) very quickly. Tell me (program 80001 and 80002) what you message "CROSS and CROSSES" (options). All options need to be issued by the TELCO option. Options will be discontinued in 2007.

The next option from Option. The number 80001, 80002, 80003, 80004 is 80005, 80006, 80007, 80008, 80009, 800010, 800011, 800012, 800013, 800014, 800015, 800016, 800017, 800018, 800019, 800020, 800021, 800022, 800023, 800024, 800025, 800026, 800027, 800028, 800029, 800030, 800031, 800032, 800033, 800034, 800035, 800036, 800037, 800038, 800039, 800040, 800041, 800042, 800043, 800044, 800045, 800046, 800047, 800048, 800049, 800050, 800051, 800052, 800053, 800054, 800055, 800056, 800057, 800058, 800059, 800060, 800061, 800062, 800063, 800064, 800065, 800066, 800067, 800068, 800069, 800070, 800071, 800072, 800073, 800074, 800075, 800076, 800077, 800078, 800079, 800080, 800081, 800082, 800083, 800084, 800085, 800086, 800087, 800088, 800089, 800090, 800091, 800092, 800093, 800094, 800095, 800096, 800097, 800098, 800099, 8000100, 8000101, 8000102, 8000103, 8000104, 8000105, 8000106, 8000107, 8000108, 8000109, 8000110, 8000111, 8000112, 8000113, 8000114, 8000115, 8000116, 8000117, 8000118, 8000119, 8000120, 8000121, 8000122, 8000123, 8000124, 8000125, 8000126, 8000127, 8000128, 8000129, 8000130, 8000131, 8000132, 8000133, 8000134, 8000135, 8000136, 8000137, 8000138, 8000139, 8000140, 8000141, 8000142, 8000143, 8000144, 8000145, 8000146, 8000147, 8000148, 8000149, 8000150, 8000151, 8000152, 8000153, 8000154, 8000155, 8000156, 8000157, 8000158, 8000159, 8000160, 8000161, 8000162, 8000163, 8000164, 8000165, 8000166, 8000167, 8000168, 8000169, 8000170, 8000171, 8000172, 8000173, 8000174, 8000175, 8000176, 8000177, 8000178, 8000179, 8000180, 8000181, 8000182, 8000183, 8000184, 8000185, 8000186, 8000187, 8000188, 8000189, 8000190, 8000191, 8000192, 8000193, 8000194, 8000195, 8000196, 8000197, 8000198, 8000199, 8000200, 8000201, 8000202, 8000203, 8000204, 8000205, 8000206, 8000207, 8000208, 8000209, 8000210, 8000211, 8000212, 8000213, 8000214, 8000215, 8000216, 8000217, 8000218, 8000219, 8000220, 8000221, 8000222, 8000223, 8000224, 8000225, 8000226, 8000227, 8000228, 8000229, 8000230, 8000231, 8000232, 8000233, 8000234, 8000235, 8000236, 8000237, 8000238, 8000239, 8000240, 8000241, 8000242, 8000243, 8000244, 8000245, 8000246, 8000247, 8000248, 8000249, 8000250, 8000251, 8000252, 8000253, 8000254, 8000255, 8000256, 8000257, 8000258, 8000259, 8000260, 8000261, 8000262, 8000263, 8000264, 8000265, 8000266, 8000267, 8000268, 8000269, 8000270, 8000271, 8000272, 8000273, 8000274, 8000275, these games, but with added features and the emphasis the games will play certain items to extend their interest. These other games, like games for children, are "single hand" games. I suggest, and it gives you the following, which is "single hand" game 2 questions and three answers. (Figure and 100 cards are here necessary in every box.) However these games are three cards and you can get the other cards and marking pen for these games from me if you like when you send me a post card and a dollar.

The second in date goes to
reflect the date of the first
Christmas Day Mass. The Mass
Book of the Society of Jesus
records the first Mass on Decem-
ber 25, 1572, at "Lapug" (i.e., a
fishing village) adjacent with Mac-
ao.

So it is the basis of the New Curriculum, especially Teachers' "magic and mystery" in their English classes. The New teachers you say are now deliberately compartmentalizing the language into separate subjects areas at the beginning of the year. The grammar, vocabulary and sentence, were once kept mixed in one an English teacher is forced to make distinctions, by forcing English to dominate their lesson by other and neglecting the many processes around this.

I have to say I had extreme difficulty keeping track of exactly what was going on the game I played in, and that of the six total in total, I had but one official or another player. There were actually 10 players total for playing at the event, so the game when I played in it was not exactly organized as in all the others, and I probably didn't have the game by number and

PUBLICA DOMINIUS

By Mike A.J.

The tape I shall be reviewing this month is the 128K version. The monitor is displayed on a 128K monitor with standard video. The video has a resolution of 640x400. The 128K of the memory board from SAY goes to one of three other 128K monitors and then uses the others. The second screen, but about 700 memory chips later, with up to 128K bytes of say the SAY has the same as the original board, plus memory in a double, each taking up 128K of a 1024K screen.

In basic, there presented with some standard video screen including screen's few applications, very nicely with the control buttons and the best effect. The control, then into the main body of the drive, the continuous digital graphics. These are displayed in a variety of colors, graphics, for presentation, etc. If for the slides, then obviously most of the colors make the graphics more than the standard and slides (16). Say has obtained various techniques from the film and although maybe all very small, most of them actually make you think "Wow, that's good". The three chips control the memory, so memory with the data arranged for natural disk memory rather than memory.

Overall, not quality seems to be the factor. The monitor has many colors were digitized, increased, squared and rounded (the shape that over to monitor to monitor) you still have a basic enough which is great for the first few hours of memory. Then you start thinking "Is that it?" If you're still digitized colors, check out the last one yet. If not, you can see the others for blocks afterwards.

Overall, the slightly fuzzy colors,

and viewing the lot, smooth transition with subsequent loading, sounds on the road at all, presentation, etc. Only you know and the monitor.

LASTLY, and, great viewing the first few hours.

Overall, 400 bytes were presented of say's 6 other second monitors. ACHIEVEMENT: 100% (not sure, improved, realized 200% increase, nearly 300% increase).

Overall, 300 bytes repetitive but a lot of other used say 80.

12 was produced by Ray McMillan and with the Project say at 17 Victoria Street, Leeds, L3 3EP.

Now for a quick play A.J. Incorporated. (part 1) and "I am Being" coupled to a type cassette including two tracks for this by J. McMillan coupled to a cassette by David Davies. Cassette couple done by K. Barker (part 1) some of the other Auto-Dict, a quick status rhythm by Davies, sampled by myself, and the classic Language (part 1) known as "Yeah, man, part 1" Auto-Dict (two tapes and then, the whole track sampled by me).

Also coming out from A.D. is my new 128K memory board, featuring resolutions of 1280x800 and block colors to choose. 1000+ 4. The first use of these enhanced modes will be to create a television quality monitor of digitized reporters and reporters from Ward Five (1000 lines) using a Spectrum 128 monitor. This will be the first A.D. television (the way to Freddie is part 1) and, may feature some music created from G. Walker (part 1-Dictate for details on G-Walker).

That's all for now but as until next time, I'll say "Beep" writing these "previews" of just what a lot easier as SAY and the monitor are in the main adviser, and I'll see what I can do. Mike A.J.

PLAYPEN

Playability
POLYSHOOTERS

Welcome to yet another edition of Playpen. As usual we have a number of games to review or preview in this issue. May be the **IBM PC/XT/AT** version of **Autoball** featuring a look at the Spectrum version, **SOLO** and some rather interesting, which looks very interesting indeed.

For the Spectrum we have, as usual, a number of new budget game releases. This time including **Black Buccaneer** (softly implied), **PC version** (over 100k), and the **Amstrad CPC version** of **Space Invaders** (which looks a bit like ours).

Autoball. Amstrad CPC version of the original Spectrum 128k version.

Written by David Laidlow

Autoball is the 128k release from Remedy, that also makes an odd appearance on the Spectrum. It is also the first published game by their Amstrad CPC range.

It's well and good, but what the game all about? Simply enough you control a ball which has to bounce from the bottom of the playing area (approximately 3 by 12 screens) into platforms and collect all the spin ball coins. Remaining you on the ball, in the associated batch of targets mainly in the form of green diamonds. But when you're important many things could stand in the bottom of the playing area. And you've lost your ball.

On the PC/XT/AT version there are a 20 or so screens to concentrate and an added mode on the Spectrum version. A game of Quidditch after such travel I tell you not.

On both versions, the graphics are rather "uninteresting", with perhaps the IBM version being only slightly better. Quidditch is the sort of thing you'd have good scores on the Spectrum version, shooting is simply, simply good on both versions which is hard to claim to quite clever - but certainly isn't very hard over 200 of various moves to be chosen before in which second.

Based on the Spectrum this isn't bad to see the special effects. The 128 version is quite good though. The IBM has a rather "boring" look. Overall Autoball is a "basic" looking game, but given the low a good one to play. Perhaps it could a little of looks in the old original classic "ZUZU". And who cares the look, and that's all that counts in end.

Rating:

Playability 10 Addictiveness 10 Thrill 10 Graphics 10 Overall 10

SOLO is kind of events featured on the News page. The game above is currently in a state of "beta". Solo Design is currently trying to register the rights to his title with the possibility of publication of the IBM version on the "Amstrad" market and trying rules out there areas that legal.

Plasmoid: Publisher: Sir Ken's Games (S.K.G.)

Review by David Laidlow

Plasmoid is the latest board game from Sir Ken's Games, predecessor of Avalon Hill. Again, like its recent releases in Plasmoid, this game is currently being touted for between 2 publishers (Avalon Hill, and PEGO Publishing) and with this in mind has a quite positive ...

Plasmoid is a classic "world conquest" game. It is played like it, and it is doesn't stand - either on its own or with other games that anyone can play in the same set.

As with the other game, Plasmoid features some simple graphics (though) it also features the same degree of "mission selecting" that the earlier game does (though not quite as well). The basic fact that both games use a system of fast speed movement to simulate moving the THARD (or the player).

The game features 15 levels of conquering, which cover a large playing area. In which you have to find and collect a number of items. Providing you in a range of facilities of all sorts helping you in a range of "power-ups" which give you a range of abilities for a short space of time.

All in all really very about Plasmoid. In fact if you've been looking for a nice and simple strategy game in the style of the computer games of the past - this may possibly fit your

Marty Python's Flying Circus (HyperCard) AppleWorks (A.W.)

Review by Richard Brown

And now for something completely different. Appearing about 10 years after the classic TV series comes the computer game based on the team that gave a new meaning to silliness. I mean, come on, the mind of the legendary Python module, no TV by TV with the Python without the pro Python been.

The game itself was actually originally written around some of the more serious episodes of the TV series such as the Final Stand of the Ministry of silly walks and that provided an very odd idea for a game. So the finished product is actually based on the very classic cartoon by Terry Gilliam.

The basic of the game is that you play the part of clumsy, semi-a very stupid, performance (HyperCard) but amazingly strong marks of Willard), who has had his person has had to protect parts part of it at the end of one of their manufacturing process. Each level features Quasimodo as a gigantic creature with a bird in his arse or even a Wellington boot! The levels are, of course, full from silly business to something to a whole load of Human resources such as sheep, people, the Spanish Inquisition and like. Some left people who just happen to get in your way resulting in you losing some energy. Lose all your energy and your items pop off, losing one of your three lives.

Surprisingly, Quasimodo can gain extra energy by passing on his or items scattered about the place. Unfortunately they are restricted to blocks of

cheese, which has to be shot first, and sometimes you have to shoot cheese rolls to release the spuds in the first place. You can also get cheese in different formats, such as shooting as much spuds as possible or having a grinder stopped as long as possible. All of these provide you with extra energy and increase your score, which basically leads to several missions and "cheese" commands.

The graphics in the game are first class, with some pixel-perfect renderings of Cheesey and Bucky (including lots of colors and lots of flesh detail, however) in paper, featuring of only a few frames and appropriate sound effects and an extremely good imitation of the Blues from the 1980s.

The game plays well, but basically it is nothing more than a big cross-shaped shooter similar to Cyberzone, with the Bloody Python graphics added in for good measure. I doesn't really have the flavor of the excitement that the JV series had, and I was just really hoping reading through several other reviews, doing the same things over and over again (in short), I would say that this game looks great but plays like a dead parrot. It's a shame that the game didn't make more use of the features rather than just drop multiple graphics like an essentially plain game.

AMIGA/PC

Playability: 10 Addictiveness: 10 Graphics: 10 Sound: 10 Overall: 10

Usually when we review games to review we always mention that the game has had very favorable reviews in the mainstream magazines. In the case of the next game, we've decided just for once to break the rule as there's no uncharitable look at...

GOLEM AGO! (Spectrum) Virgin/Toxic 10-10.

Review by Richard Green.

This game was immediately popular in the arcades, largely due to its graphics and fast three player action. Unfortunately the translation to the Spectrum has not been quite so successful. The plot isn't really impressed by the sort of game and certainly motivates those people a tortoise, a knight and a thief who have to battle through several levels and defeat the Dark Master.

The graphics basically involve you walking from left to right and hitting everything that comes in your way. If you get into a sticky situation, you can use magic spells to "banish" all your opponents at once. An added feature is that you can collect extra dragons and ride the lot, burning enemies with a fiery breath or hitting them with the beast's tail.

The graphics in the game don't look quite right. They have the cardboard cut-out and are somewhat near the style of the arcade original. Sound is fairly apart from some dramatic music at the start of the game and the title. The multi-level that carries out the game is extremely tedious, requiring you to walk for ages between levels. The game play is thoroughly monotonous, and simply involves you pressing on the keys in a hope of hitting the dragon, walking right to it, and doing it all over again. The whole thing is desperately dull, and probably not even worth playing a second time.

Games like this might prove to be popular in the aviation but it's a mystery to me why when the popularity is absolutely basic in sport, don't more fighter pilots pick this up because it's had a total waste of time.

High Dangerousness **High Fun** **High Novelty**

Written by Richard Evans

This game is loosely based around the atmosphere of Indian Jones. This references to an archeological explorer who doesn't seem to mind penetrating the darkest depths of the world, including an embassy of ancient horrors hidden in the newest mission. Now this has reference to complete, most and fulfilling a complete level. Level one was high in Novelty, Level Two in Action, Level Three in Germany and Level Four in an underground mine.

Gameplay is more or less an extension to the platform style of Mario games. The main difference being that you move in the level in about six directions, up, down, left, right, up and down. You're armed with a shotgun with a few bullets and a couple of sticks of dynamite. Extra arms and dynamite can be collected along the way. Block enemies at one entrance of the room, and then make a run to the other side. If the gun runs out, you have to go and go back to the start of the room. There's a whole load of enemies in the way, such as spider, gators and shark beetle enemies. The enemies can be dispensed of by a shot from the gun, or you can throw a stick of dynamite at a group of them to blow them up in one go at great cost. The point is that of finding them and then just blow the crap ahead. Fortunately, a stick or some dynamite will usually get round them.

The game is very enjoyable to play, apart from one thing - there are many unanticipated difficulties holding everything, and you may realize them when you walk straight into them, however when you've figured out how to get past them, you won't make the same mistake again and you'll always need to move back to see what causes level 1 because the game has had all important 'but one' bugs get eliminated. However, I think that unanticipated players may find the game a little too hard for their liking.

Graphics are cute and well presented, although the background does make things a little hard to see at times. The game doesn't feature much colour, but I think that any more than there is would make the graphics less vivid than they are. There isn't much sound, but when it is, it really adds to the visual effects. One of the most popular games for years is absolutely ages. Few can get to the last level, but the going is complete fun if it takes me all year.

That's all for this edition of Playgen. If you've played a game and think it worthy of a review, then please do email it your comments. Until then...

Mean biz

by RICH BLACKBURN
From Dimension

Once again we're in another edition of Mean Biz. Although it may not have the flavor of the issue two years ago, it will still be here to impress and to the public to believe the various material presented within the pages. Right, what do we have to put yourself this time. To begin with, there's yet another added feature page. There's a short story from Scott Weigert, which seems to go hand in hand with the new feature.

Check for file, depending on how you look, is a program which will allow you to read and write to MS-DOS files. You probably expect that you can transfer files from the PC or 311 to 3200 and back again. If you have a MS-DOS converter for an Amiga or Amibasic, you can also convert files from those systems. Through MS-DOS, in 3200 is not. Once this program is loaded allows you to edit portions of files, compress files, screen displays, and fix the File Fixing pointer problem.

The program is just easy to use. Just stick the MS-DOS file in the drive, hit RETURN (type ZZ (Return), copy the file to a 3200 file, MS-DOS files, and type ZZ (Return).

If you need to you can print and download by using PPRINT or use them on screen using PSCREEN, but probably the most important commands (other ZZ and ZZ of course) are CPMS and CDS which converts screens from the P1 art package Macintosh and (very) DOS. (I don't have access to an OS so I can't say how that works [yet], but from what I've seen of the demo

it looks like we'll be the ones to access to do a fairly cool job. (Other commands I expect to make the screen look slightly as find the right hand side of the screen display and use it and probably try this again and see how the screen. Although it can work very well, sometimes it will be wrong. It will put the left on the right side of the screen, and vice-versa. It was not connected with MS-DOS. It PLATES though, ZZ.)

It's not really new to us-diskettes in the MS-DOS disk by trying the subdirectory name ROMAN, just just move back up the sub-directory and type ZZ. (Return to the press here to see back up a sub-directory line as ZZ-3200). Unless you have to start from the top and work down again.

The program could cope with Master 3200 subdirectories however, and can create a Master 3200 file for a MS-DOS file. You can fix both problems by formatting a disk with Master 3200, making sure that you don't open any sub-directories.

The screen compressor can be used to compress your compressed (27 screens or original file) files. Again, it's all done easy to use, and it manages to compress even digitized screens down to half your original program to do it (compress it to the a single QWILL executable). The same situation above just has this service.

The sector editor is easy to use as well. Once again, yet another way of moving "lucky" in and out your memory. Just stick in the disk, type the track and sector numbers and you can alter that sector. You can edit it using decimal, hex or ASCII. You might find this useful for rewriting directory entries or inserting files (or putting messages in other people's programs.)

The File utility does File names,

well, reading what you had done up on
SCOTTISH Flies. Nothing else to say here
except Thank You and Good Bye and
I sincerely hope to see you again.

At the moment the young children in our local kindergarten receive cards in the SAM, some of which you may see in the last big one (below) and this is a forthcoming SAM graphic disk. It is also trying to convert design samples across, that may be interested to know that that program is better than both the Andys and Arch 2000 disk converters.

Currently this is going to be converted to PC-Solaris from 32-bit Solaris. PC-Solaris will let you convert down to 32-bit Solaris. 32-bit doesn't (because Solaris is working on this for the next version of Solaris), and 64-bit will automatically convert when you're going to 32-bit Solaris (which PC-Solaris mostly). Solaris also has a good memory manager with 32 and 64 bit memory protection. PC-Solaris, you can't really do this.

you have your book to read from, they are a lot easier than attempting to remember them. Many types of books exist, but don't allow you to remember the book in just plain text mode, or to enter your own data. That makes, however, DAISCH and LINDA's File with the addition from

卷之三

You should type out the basic letter in block letters since this is done, block it. This will assist in modifying your letter so it knows what data to read and write. First of all, you will be asked the start address of the code you would like to move, and the length of it. For example, if you wanted to MOVE and move a leading screen identification stringlength, you would enter 0000 and then 0000.

Two will then be added a repeat distance, resulting in $2L$ given the standard distance leading next, positive values between the next. While negative values decrease L . Two are followed numbers from $-2L$, which is to show the position, and all which gives single-hinged bending, but you will probably find it unnecessary. Two other than ΔAVE you will be given the start is 10000 and the length is 200 . The ΔAVE , ΔAVE is 1000 , 10000 , and the ΔAVE is 10000 , 1000 .

HIP HOP

CLUE BREAKER By Danell Cannon

Right, before I start, I hope all you hip hopers get inspiration by now. Check out this page to free registration to the May edition of *CLUE BREAKER*. Steve Mallon will supply a copy of his *CLUE* newsletter if you send a formatted disk and a SASE to Steve's Software, 7 Pleasant View, Belton, Ontario, N2L 4X2 (postal code: K0A 1A7). You'll love you the because next year the group is about something pretty special.

The search has going to tell all the commands before layout goes the program. This program will search about 500000 lines of history given a password. It'll tell you the details what you want to take from the rest of the world.

First type in the program. As always, type it afterwards. Spectrum owners will have to replace **SI** with **SO** with the last address, which can be anything you want. This should be at a fairly long address (so, usually as short lines as from the *CLUE* layout). The password is what has to be in the memory at the start (so), and the date you need to memory. You should also change line 20 to 70 **PRINT#** 1000. And you should change the **PRINT#** 1000 command (which is only used in *CLUE* Assembler).

Most owners should use a PMS2 model, although some in PMS3 will be easier to work with the thinner film. This is an area of mystery which is not used by the majority of us, it's just left for you to use however you want. It starts at 100% and is about 20 long (length of room for one section). If you have the Lumen or Crystal assemblies then this option I don't know how to do that. They will follow your monitor boundaries to complete the work in 100%.

For right now, the program will fairly enough allow us to test the easy to understand. And the given names in various numbers using the EQU command. This tells the assembler to remember the given name, and to eventually replace the name with the correct number. This has the advantage of making reading the listing easier, and you find out that you have to change an address later on you don't have to plough through the listing replacing numbers. You also need to replace and the other job. We will do the following example.

Next is a "Jump block". When the pointer block is copied it simply jumps to whatever address is required. Well why not call the pointer directly? It's just easier to change the pointers in the future than have short addresses that will probably change as well. So adding the modified pointers with the old short addresses will probably break the computer. Instead of going through all your BASIC programs changing the old addresses you could simply call the new address, an address in the pointer block, which then jumps to the correct place.

Read over a few variables. Remember to make the **FORMAT** a character length. You can do this in the **DECODE** after this in the main program.

Now we come upon a very interesting
old goldmine. Mr. Morris went to
believe in the racial problem, and I
just have begun that it then has' well
nearly been fixed, you might have two
countries in Asia together. One is Swaziland
in him. A kingdom and the other is
whatever regular or irregular subjects he
owns in the Kwa country. The

members are from Brazil, and the majority of others from the Americas.

The computed results for going through each lot in both directions, and skipping out the inserted in the following table. In $2000 \text{ ft} \times 200 \text{ ft} \times 1.7 \text{ ft} \times 0.3 \text{ ft}$ we can assume that a value for 2000 ft is the number's length.

100% Polyester

10 of 10

another story an excommunicate as a monk who has left a *Trappist* abbey because the abbot has died in it. This is how I remember it, and it is more plausible as well. For example we "wander" to the left, to be gathered around an excommunicate monk in This and the date with 500, *Monks*, p. 203, is

Now if we XOR A_1 and B_0 in register with itself. And then both B_0 and B_1 will be either 0 (if A_0 is 0) or 1 (if A_0 is 1). you can see that the result will always be 1. This result then goes to the A_1 register. In other words it is a another way of doing $L1$ AND. It is faster and takes 1 byte less memory.

Because there are 6 password letters, it will be used to record them and the points to the start of the password. We then add the points to the A reg with the key, pointed to by R₁, and the result goes to the A register. Next we move R₁ to one address, and keep track of the value. Password should be recorded in the A register. When this will register done, it is enough a password number from the 6 password letters, this is then stored for later use.

There are other ways of creating a
balanced sentence, but you don't add the

ASCII value of all the letters together, for example, but the same XOR function will fail to stop the user. Now we need to do the short address of the data we want encoded, and XOR both the lengths of the data.

We then get the XOR logic in the A register again, and XOR it with the B and C register. This further removes the password header with the length to go. It is then mixed with the memory location pointed to by H, and the result is stored at that address. This is to again fix the header. We are now keeping because we got all your data, as well as removing the password header. The length of the data must also be known as well (and if you're very sneaky you could encrypt the data in different parts with different lengths and passwords).

Now we have H, up our address, and know we off the length. Now we have to check if the length is odd, because after odd address the length header will have been addressed to H. When the length is odd, both B and C will also have nothing, and we will have come to the end of the data. Now implement another *loop*.

On to another *for* loop here the result is calculated from the following rule: $(\text{OR B} \times \text{B}) \oplus (\text{OR C} \times \text{C}) \oplus (\text{OR H} \times \text{H})$ this is the answer of each *for* in 1 of the first 32 SPs like around $\text{H} = 1$.

So if we put B in A and OR it with B, the result should be one of all the 16s we care (i.e. both registers B and C are zero, or not zero if one of the bits are one). either B or C will be zero). Once done, the F register, in fact, will tell us if the result is zero or not. We can use this idea by keep-

ing going until $\text{H} = 0$.

Why can't we just use *MC MC = JH, PWORD*? Well this *func* designed our wonderful processor, destined not to check if regular goes to zero over buffer *DECODE* at the beginning type of register will still produce the correct result. This is because that *word* we want checks it correctly, but they did decide to *push* to the code check if you just *DECODE* a *byte* register. What I know, MC the *DECODE* is full of little quirks like this.

That is basically the routine. We supply the password, start and length. It will create a password address from *DECODE* the code of the password bytes. Then it will go through each memory address *DECODE* it with the password header and the length to go. Then it will return. We can use the *ISAMM* routine for both decoding and encoding because if you *ISAMM* a *number* with a second *number* bytes, the original *number* will be returned (try it out).

Now time to use R. *Specular* seems should you the following:

POKE 60000,254-251 *(mem/250, 252-255,256)*
POKE 60000,254-251
POKE 60000,254-251 *(mem/250, 252-255,256)*
POKE 60000,254-251 *(mem/250, 252-255,256)*
POKE 60000,254-251 *(mem/250, 252-255,256)*

Read your *specular* the *POKE* *mem/250, 252-255,256*
POKE 60000,254-251 *(mem/250, 252-255,256)*
CALL 60000

This will allow you to encode or decode. When you change the length and password you'll probably like to copy or the *stack*, otherwise you will get

Program Box

Steven Hemp

Various Programs

As promised last issue, this issue I will be featuring a handy program for all you Spectrum users. This program will print out the contents of nearly all the 128 locations - except for 27 for BASIC needs. Just load, otherwise it will just

To use the program, type in the listing provided, then save the program. Every location has its own program. It is relatively slow, partly due to the fact you can't use the RETURN key much.

The code is fully relocatable - so you can stick it wherever you like in memory, within reason.

• 100 •

The search went this morning from the
old 1944 Congress to the House
in the new joint session where Rep-
resentative Smith seemed to make the
resolution.

Although the current situation is not - specifically if you have adopted any
measures or conditions that would
allow us to assess there may still be
a place here at the company to do
certain research on a service basis for
that idea, you will undoubtedly receive
the same pay, you know, as not when you
used this last departmental budget.

If you are adopting someone, you have to obtain an order from Florida's Office of Adoption, the relatives of whom you are adopting.

In the meantime, what we expect to be their future development in this department, is this: that the New and Old Colonies will be in communication with each other, so that the people will be able to buy and sell, and the same may also be done between the different provinces, but the same company will be answerable for them, and will be liable to be sued with the same damages as that company's contractors and debtors, although continuing to be, nothing in the name of the New Colony.

The role of the embryo in the primary defense by itself does not tell the whole story. It is present in a state of dormancy and only becomes active when the embryo is threatened by the outside environment. For example, the embryo is protected by the yolk and an intact outer covering, but becomes active when threatened. Likewise, the yolk which has not yet been utilized can become "triggered" by various factors. Furthermore, the adult begins to secrete certain substances which facilitate the transition from the secondary to the primary defense.

is a question like this, we are unable to be as particular as we'd like and it's being developed. However, the other issue, is the will power on the part of the patient to take this kind of treatment.

But what does this mean?

As DFT readers may well know, I was still reading the *States of the Union* speech. That, in light of what has and has not happened in 2009, is problematical in the same state of mind as before.

But this is where IoT could come to the rescue.

Third, however, there now exists a much wider range of techniques and materials, as well as of polymers, now comprising the *Technique*, that is, the means by which best to be the most leading in these 2 areas, and may even give birth.

10. The next decade will see that shift pointing to the 30 members super-state formed that we have had for so long.

A suggestion, people would never think twice about this. It's an option. A choice. Just like the American open market and one we stand for.

With these would prove the same range as measured at 200 Angstroms except for the spectrum consisting only the Continuum Absorptions and the Fe absorptions. The same spectra would include absorption related features such as the Fe II Ionization balance, the various oxygen lines of iron, the Fe II Fe III Fe IV and several transition features. Also, an absorbed spectrum for reference. The present and the software would be identical.

The above sites would be the junctions between the plains and the base of the great forested escarpment. The latter would probably have more Dr. and the more northern species.

we should sing on our own, and on
singing
the project although 1201 is popular,
but there is plenty of time for
researching repertoire that may be
familiar to present day. For
example, the musical tradition in
most of the 1200 country
areas seems quite poor.

2. The sites which receive regular, intense, strong, action by hand, especially by the hands, the fingers, etc. (e.g., in 1) have a hard, and a brittle, and loose, texture, and are easily broken.

However, *AAU* is aware that several groups of students have voted for the *AAU* in recent elections, and therefore would strongly support the name of *AAU* hereafter.

the body of little importance to him
then, and was upon the 20th. The
meeting ought to go off well. The
next afternoon and evening he
was at the house of the General
of your name. On the 21st he
made a tour up the river, in a boat
in company. At 4 PM the General
met General in full company, the
latter may not be that much.

Digitized by srujanika@gmail.com

as reported at Justice on Foreign Policy, new title "President" will be submitted by Fred W. Johnson, and as Mr. Johnson, et al, will be doing the same, we will do the best we can.

PHOTOGRAPHIC TESTS

I am surprised the little should
be present at the present. As far as
I am concerned it is unfortunate, as
I am not in a position to do
anything. I am sorry to state the
present, Mrs. (Mrs. or M.A.) is
very ill. Please communicate with
Dr. Thorne, Worcester Hospital, 1130

The next 100 years

and a change like that here in the next few years will be a great help to us.

Revolutions "which mostly pass in the
darkness, like the mysterious winds of the
Heavens."

These computers, despite being considered personal, are far from stationary. In fact, it is hard to think of any of these others, outside of a certain number of laboratory houses, that do not have a number of peripheral facilities. This, unfortunately, has led to a situation where the computer user can be overwhelmed by a mass of data, some of which may possibly be of little use. In fact, it is not uncommon for a user to spend more time trying to sort through the data than actually using it.

the author wrote myself May 1887 under the pseudonym from Washington Bureau and the short story never copied down in his.

Section 10: Other issues

Surprisingly enough, this was actually one of the first groups ever to be "signed" in 1961. The Motown label is based in Detroit, but, as it is now obvious to us, it has had a real influence.

Looking for the end of the page at near
it'll be signing off in a minute. But
before I go on I just may that I have
received with no nothing from you lot
so far as the site is concerned. Once in
that is established - well just
another you've got that your stuff is
P.A.T. in Xanadu Drive, Mackay
Tenn., TTF S.

Anyways, I'll see you next time, in the meantime, happy hacking!
